1. Overview

1.1 This Functional Specification defines communication functions for LV-7490.

1.2 Compatible to Firmware Ver. 1.x of the projector.

1.3 Most commands can be used to control projector remotely from PC by RS-232C. Therefore, the commands are defined as Expand Serial Commands.

2. Serial Interface Specification

2.1 Transfer Specification

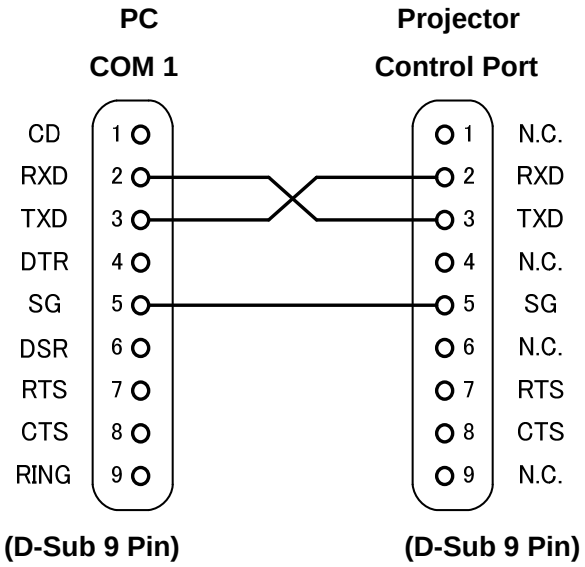
Item	Specification
Synchronous System	Asynchronous
Transmission Speed	9600 / 19200
Data Length	8 bit
Parity	N/A
Stop Bit	1
Flow Control	N/A

Note1) Transmission Speed: initial setting value is 19200

Note2) Transmission Speed can be changed in service mode.

2.2 Connection

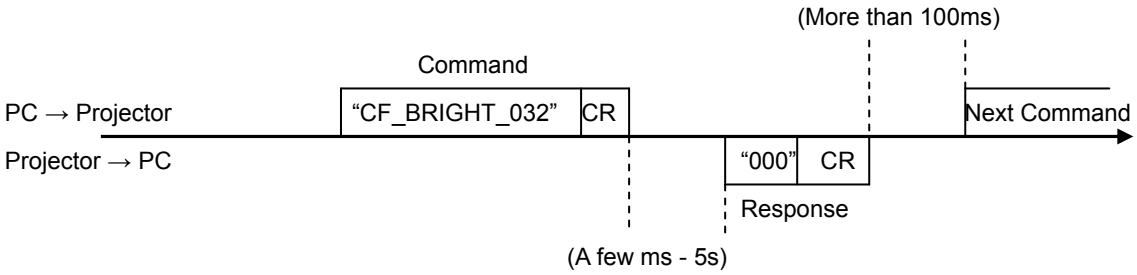
Dedicated serial cable must be used for a connection to a computer and a projector.



3. Notes for communication

1. Expand Serial Command is defined as one command / one line that starts with “C” and ends with carriage return (0x0D)
2. There are two types of commands: Functional Execution Command and Status Read Command.
   - Example of Functional Execution Command:”CF_BRIGHT_032”[CR]
   - Example of Status Read Command: “CR_RIGHT”[CR]

   Note) ”_” means a space
3. When it takes more than one second to receive one command, it is not executed.
   When it takes more than one second to receive carriage return (0X0D) after the projector receives the first data “C”, it clears the information of buffer.
4. On command pipelining, wait for the interval of 100ms till sending next command after receiving a response.



When a computer sends next command before receiving a response, the projector may not operate properly, except when there is no response for more than 5 seconds.

5. It takes about 5 seconds for internal initialization after plugging in AC power. During this time commands cannot be processed. Do not issue any command.

4. Name Definition

1. Data from a controller to a projector is represented as COMMAND, and data from a projector to a controller for the incoming command is represented as RESPONSE.
2. [CR] : Carriage Return Code
   Command ends with cartridge return code.
   Response also ends with carriage return code.
3. _ : Space Code
   A space Code is indicated by (_).
4. %1 : Parameter in Command
   When there are several parameters, they are defined as %2, %3…
5. %%% : Error code returned from a projector
   Acceptable: “000”.
   Unacceptable: See [7. Error Code Table].
6. %a : Parameter in Response Command
   When there are several parameters, they are defined as %b, %c…

Error Code	Contents
?	-When the received data cannot be decoded -Parameter determination error (digit number error, including invalid value, etc.)
101	The function is not available in the selected Mode
102	Selected value is out of range (Not reflected)
103	Command mismatched to Hardware (command for Optional function which is not installed)
201	When reached upper or lower limit of increasing or decreasing data
301	Command cannot be executed during capturing display. Resend the command after a while
302	Command cannot be executed during Auto PC operation. Resend the command after a while
402	Command cannot be executed during PIN code operation. Resend the command after a while.

Note) These error codes are applied to Expand Command, not to Basic Command

8. Functional Execution Command

8.1 Format

1. PC issues commands in format as below:

Pattern1: "CF_COMMAND" [CR]

Pattern2: "CF_COMMAND_"%1 [CR]

CF_ : Header

COMMAND : Character line

%1 : Parameter (Character line)

_ : Space (To separate COMMAND and Parameter)

2. The projector decodes the received command and when it is ready to receive the next command, it returns the response.

"000" [CR] : (0x06, 0x0D) When receiving Functional Execution Command

"nnn" [CR] : Except "000" , when it is unable to execute command by any specific reason.

See Error Code Table for details

3. When the received data cannot be decoded, the projector returns "?" [CR]

8.2 Transfer Example

When setting projector's total dots to 1344 by Expand Serial Command

PC → PJ: "CF_TDOTS_1344" [CR]

PC ← PJ: "000"[CR] - - - - - - - - - - - Acceptable

8.3 Operation Requirements

1) Functional Execution Command is limited when the projector status is as below.

However, Status Read Command is effective even under these conditions.

9.12.4 CR_FREEZE Command

Command	"CR_FREEZE"[CR]

9.12.5 CR_TEMPWARN Command

<tr><td>Details</td><td colspan="2">Get the temperature inside a projector and its condition if it is abnormal temperature or close to abnormal temperature
If there are several sensors installed, it is possible to get information from all the sensors at once.</td></tr>
<tr><td rowspan="3">Response</td><td>Acceptable</td><td>“000_%a_%b_%c”[CR]</td></tr>
<tr><td>%a
%b
%c</td><td>%a ---------- Sensor 1 status
%b ---------- Sensor 2 status
%c ---------- Sensor 3 status

“W” ---- Approach or reach abnormal temperature
(dangerous temperature)
“S” ---- Far from abnormal temperature (safe temperature)
“N” ---- Sensor detects no abnormal temperature

[Example]
“S_W_S”[CR] means Sensor 1 detects safe temperature, Sensor 2 detects abnormal temperature and Sensor 3 detects safe temperature
Note) When the temperature difference between Sensor 1 and 3 reaches specific value, some of the models detect it as Abnormal temperature. In this case, the 3rd data shows if the temperature difference between Sensor 1 and 3 is dangerous state or not. The 3rd data means temperature abnormality due to Sensor 3
When abnormal temperature is not detected by sensor, “N” (No connection with temperature abnormality) is returned.</td></tr>

9.12.6 CR_TEMP Command

<table>
<tr><td>Command</td><td colspan="2">"CR_TEMP”[CR]</td></tr>
<tr><td>Details</td><td colspan="2">Get current temperature inside a projector.
If there are several sensors installed, it is possible to get information from all the sensors at once.</td></tr>
<tr><td rowspan="3">Response</td><td>Acceptable</td><td>“000_%1_%2_%3”[CR]</td></tr>
<tr><td>%1,%2,%3</td><td>%1= Sensor 1 temperature (Outside temperature)
%2= Sensor 2 temperature (Inside temperature1)
%3= Sensor 3 temperature (Inside temperature2)

%1,%2 are consists of 6 bites fixed
There must be 1 space between %1 and %2, and, %2 and %3

e.g. _31.5F

“_” means a space and “_” changes into “-“, when temperature gets below freezing.

e.g. -05.5F

The last character shows if corresponding sensor is under abnormal temperature.

“F” ------- Abnormal temperature
“W”-------Close to abnormal temperature(Temperature is as high to display Warning)
“S” -------Not close to abnormal temperature (Temperature is low enough and safe.)
“N”-------Applicable sensor does not detect abnormal temperature
“E” -------Not able to return temperature data

When several sensors are incorporated, projector returns values continuously.
e.g. “_31.5F__35.2S__38.0W”[CR]

A data of sensor 1 comes first and a data of sensor 2 follows after 1 space.

As described respectively in e.g., sensor 1 detects abnormal temp., sensor 2 detects 35.2 degrees which means safety, and sensor 3 is 38 degrees which is close to abnormal temp.
In case projector cannot return its data due to some hard ware failure, the last character becomes “E” such as “_00.0E”.

Some of the projectors get abnormal temperature because of heat of Lamp ballast in Standby mode or Powering ON.
Therefore detection of abnormal temperature is suspended while Standby mode or adequate time after Power ON, and during that time projector returns “_----N” as a temperature data.</td></tr>
<tr><td>Unacceptable</td><td>“Error Code”[CR]</td></tr>

9.12.7 CR_TEMPFAIL Command

Command	"CR_TEMPFAIL"[CR]	
Details	Get the temperature inside a projector when abnormal temperature occurs. If there are several sensors installed, it is possible to get information from all the sensors at once.	
Response	Acceptable	"000_%a_%b_%c"[CR]
	%a %b %c	%a ---------- Sensor 1 temp. (External temp.) %b ---------- Sensor 2 temp. (Internal temp.1) %c ---------- Sensor 3 temp. (Internal temp.2) [Example] "_31.5F"[CR] "_" indicates a space. When the temperature sinks to -, the first character is "-" like "-05.5F"[CR] The last character means the sensor's status if it reaches abnormal temperature Exceeding critical temp. ---------- "F" Temp. is safe ---------- "S" Sensor detects no critical temp.---------- "N" The example shows that sensor 1 indicates 31.5 degrees and the temperature is abnormal. When the temperature is safe, all data are represented as "□000S". When the projector is reset, "□000S" is set, and every time abnormal temperature occurs, it renews the data and returns it. In short, it only returns the renewed data of the latest abnormal temperature and the previous data is deleted.
	Unacceptable	"Error Code" [CR]

9.12.8 CR_SERIALNO Command

Command	"CR_SERIALNO" [CR]	
Details	Get value of the serial number.	
Response	Acceptable	"000_%1" [CR]
	%1	Eight digits of alphanumeric characters
	Unacceptable	"Error Code" [CR]
